## EENG224 HOMEWORK II

## Last submission date is $\mathbf{2 2 . 1 2 . 2 0 2 2}$

## 1.

In a balanced three phase wye-wye sytem the load impedance is $10+1 j \Omega$. The source has phase sequence abc and the line voltage $\mathrm{V}_{\mathrm{ab}}=220 \angle 30^{\circ} \mathrm{V}_{\text {rms }}$. If the load voltage $\mathrm{V}_{\mathrm{AN}}=120 \angle 0^{\circ} \mathrm{V}_{\text {rms }}$, determine the line impedance.

## 2.

A three phase abc sequence wye-connected source supplies 14 kVA with a power factor 0.75 lagging to a parallel combination of a wye load and a delta load. If the wye load consumes 9 kVA at a power factor of 0.6 lagging and has a phase current of $10 \angle-30^{\circ} \mathrm{A}$ rms determine the phase impedance of delta load.

## 3.

Find the input impedance $Z$ of circuit with transformer shown below.

4.

Find $\mathrm{I}_{\mathrm{x}}$ in the ideal transformer circuit shown below.
