

# Introduction to Phase Diagram

- There is a strong correlation between microstructure and mechanical properties. And the development of microstructure of an alloy is related to the characteristics of its **phase diagram**
- It is a type of chart used to show conditions at which thermodynamically distinct phases can occur at equilibrium.
- Provides valuable information about melting, casting, crystallization, and other phenomena

# What is a Phase?

- The term 'phase' refers to a separate and identifiable state of matter in which a given substance may exist.
- Applicable to both crystalline and non-crystalline materials.
- An important refractory oxide silica is able to exist as three crystalline phases, quartz, tridymite and cristobalite, as well as a non-crystalline phase, silica glass, and as molten silica.
- Every pure material is considered to be a phase, so also is every solid, liquid, and gaseous solution.
- For example, the sugar-water syrup solution is one phase, and solid sugar is another.

# Phase Equilibria: Solubility Limit

## Introduction

- **Solutions** – solid solutions, single phase
- **Mixtures** – more than one phase

### Solubility Limit:

Max concentration for which only a single phase solution occurs.

Question: What is the solubility limit at 20°C?

Answer: **65 wt% sugar.**

If  $C_o < 65$  wt% sugar: syrup

If  $C_o > 65$  wt% sugar: syrup + sugar.

Sucrose/Water Phase Diagram

# Microstructure

- the structure of a prepared surface of material as revealed by a microscope above 25 $\times$  magnification

# Components and Phases

## Components:

The elements or compounds which are present in the mixture (e.g., Al and Cu)

## Phases:

The physically and chemically distinct material regions that result (e.g.,  $\alpha$  and  $\beta$ ).

## Aluminum-Copper Alloy

Adapted from  
chapter-opening  
photograph,  
Chapter 9,  
*Callister 3e*.

$\beta$  (lighter phase)

$\alpha$  (darker phase)

# Effect of $T$ & Composition ( $C_o$ )

- Changing  $T$  can change # of phases: path  $A$  to  $B$ .
- Changing  $C_o$  can change # of phases: path  $B$  to  $D$ .

Adapted from  
Fig. 9.1,  
Callister 7e.

# PHASE EQUILIBRIA

- **Free Energy** -> a function of the internal energy of a system and also the disorder of the atoms or molecules (or entropy).
- A system is at **equilibrium** if its free energy is at a minimum under some specified combination of temperature, pressure, and composition.
- A change in temperature, pressure, and/or composition for a system in equilibrium will result in an increase in the free energy.
- And in a possible spontaneous change to another state whereby the free energy is lowered

# Pressure-Temperature Diagram (Water)

- Each of the phases will exist under equilibrium conditions over the **temperature–pressure** ranges of its corresponding area
- The three curves ( $aO$ ,  $bO$ , and  $cO$ ) are phase boundaries; at any point on these curves, the two phases on either side of the curve are in equilibrium with one another
- Point on a  $P$ – $T$  phase diagram where three phases are in equilibrium, is called a **triple point**.

# Phase Equilibria

Simple solution system (e.g., Ni-Cu solution)

	Crystal Structure	electroneg	$r$ (nm)
Ni	FCC	1.9	0.1246
Cu	FCC	1.8	0.1278

- Both have the same crystal structure (FCC) and have similar electronegativities and atomic radii ([W. Hume – Rothery rules](#)) suggesting high mutual solubility.
- Ni and Cu are totally miscible in all proportions.

# Phase Diagrams

Indicate phases as function of  $T$ ,  $C_o$ , and  $P$ .

For this course:

- binary systems: just 2 components.
- independent variables:  $T$  and  $C_o$   
( $P = 1$  atm is almost always used).

- Phase Diagram for Cu-Ni system

Adapted from Fig. 9.3(a),  
*Callister 7e*.  
(Fig. 9.3(a) is adapted  
from *Phase Diagrams of  
Binary Nickel Alloys*, P.  
Nash (Ed.), ASM  
International, Materials  
Park, OH (1991).

- 2 phases:  
L (liquid)  
 $\alpha$  (FCC solid solution)
- 3 phase fields:  
L  
L +  $\alpha$   
 $\alpha$

# Phase Diagrams:

## # and types of phases

- Rule 1: If we know  $T$  and  $C_0$ , then we know:
  - the # and types of phases present.

- Examples:

$A(1100^\circ\text{C}, 60)$ :  
1 phase:  $\alpha$

$B(1250^\circ\text{C}, 35)$ :  
2 phases:  $L + \alpha$

Adapted from Fig. 9.3(a), *Callister 7e*.  
(Fig. 9.3(a) is adapted from *Phase Diagrams of Binary Nickel Alloys*, P. Nash (Ed.), ASM International, Materials Park, OH, 1991).

# Phase Diagrams:

## composition of phases

- Rule 2: If we know  $T$  and  $C_0$ , then we know:
  - the composition of each phase.

- Examples:

$$C_0 = 35 \text{ wt\% Ni}$$

At  $T_A = 1320^\circ\text{C}$ :

Only Liquid ( $L$ )

$$C_L = C_0 (= 35 \text{ wt\% Ni})$$

At  $T_D = 1190^\circ\text{C}$ :

Only Solid ( $\alpha$ )

$$C_\alpha = C_0 (= 35 \text{ wt\% Ni})$$

At  $T_B = 1250^\circ\text{C}$ :

Both  $\alpha$  and  $L$

$$C_L = C_{\text{liquidus}} (= 32 \text{ wt\% Ni here})$$

$$C_\alpha = C_{\text{solidus}} (= 43 \text{ wt\% Ni here})$$

Adapted from Fig. 9.3(b), *Callister 7e*.  
 (Fig. 9.3(b) is adapted from *Phase Diagrams of Binary Nickel Alloys*, P. Nash (Ed.), ASM International, Materials Park, OH, 1991.)

# Phase Diagrams:

weight fractions of phases

- Rule 3: If we know  $T$  and  $C_o$ , then we know:
  - the amount of each phase (given in wt%).
- Examples:

$C_o = 35 \text{ wt\% Ni}$

At  $T_A$ : Only Liquid (L)

$$W_L = 100 \text{ wt\%}, W_\alpha = 0$$

At  $T_D$ : Only Solid ( $\alpha$ )

$$W_L = 0, W_\alpha = 100 \text{ wt\%}$$

At  $T_B$ : Both  $\alpha$  and L

$$W_L = \frac{S}{R+S} = \frac{43 - 35}{43 - 32} = 73 \text{ wt\%}$$

$$W_\alpha = \frac{R}{R+S} = 27 \text{ wt\%}$$

Adapted from Fig. 9.3(b), Callister 7e.

(Fig. 9.3(b) is adapted from *Phase Diagrams of Binary Nickel Alloys*, P. Nash (Ed.), ASM International, Materials Park, OH, 1991.)

# The Lever Rule

- Tie line – connects the phases in equilibrium with each other - essentially an isotherm

How much of each phase?

Think of it as a lever (teeter-totter)

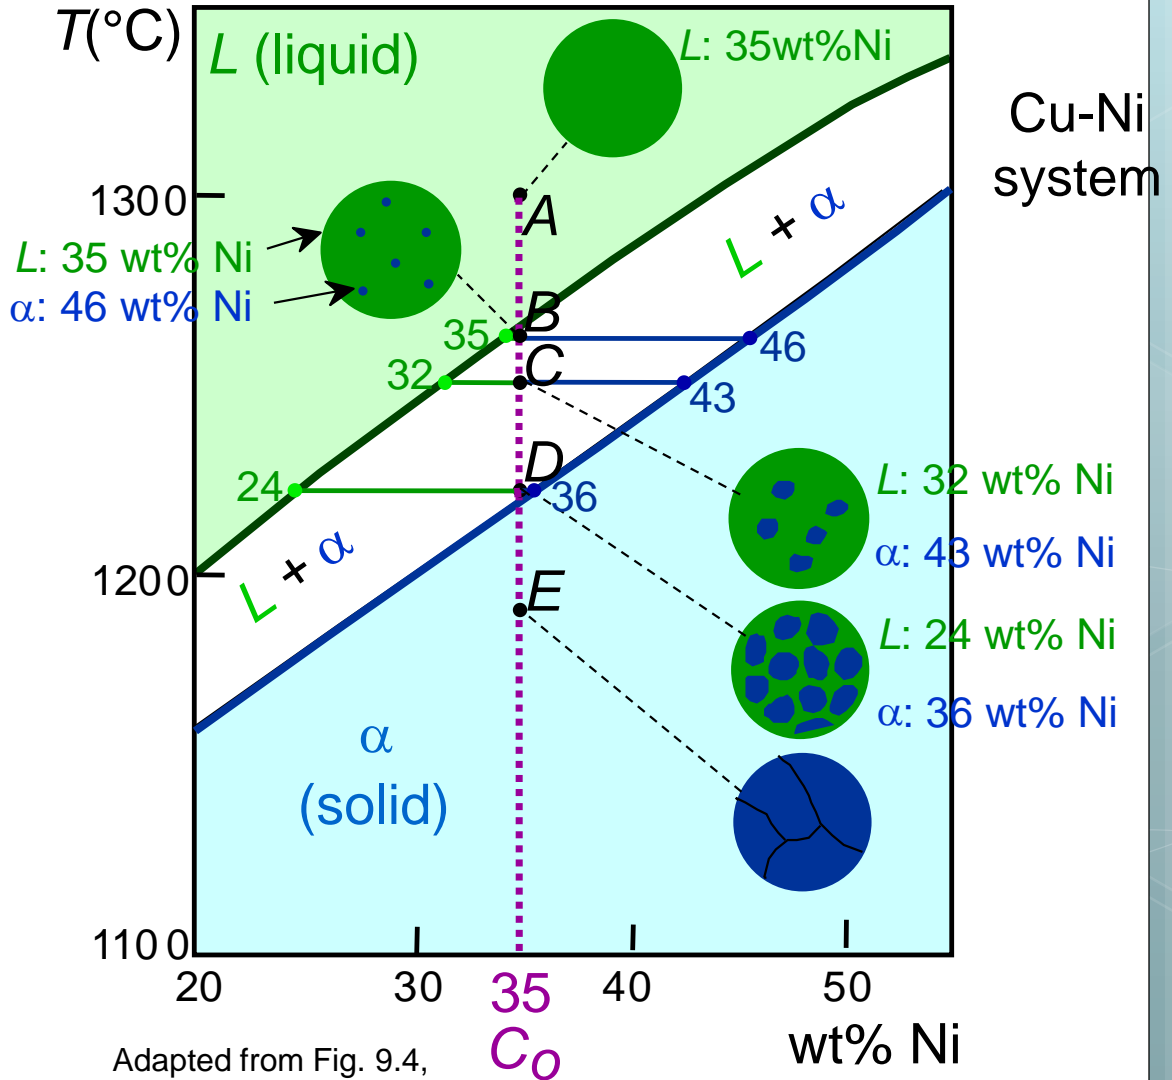

$$M_{\alpha} \cdot S = M_L \cdot R$$

$$W_L = \frac{M_L}{M_L + M_{\alpha}} = \frac{S}{R + S} = \frac{C_{\alpha} - C_0}{C_{\alpha} - C_L}$$

$$W_{\alpha} = \frac{R}{R + S} = \frac{C_0 - C_L}{C_{\alpha} - C_L}$$

# Ex: Cooling in a Cu-Ni Binary

- Phase diagram: Cu-Ni system.
- System is:
  - binary  
i.e., 2 components: Cu and Ni.
  - isomorphous  
i.e., complete solubility of one component in another;  $\alpha$  phase field extends from 0 to 100 wt% Ni.
- Consider  $C_0 = 35 \text{ wt\%Ni}$ .

# Cored vs Equilibrium Phases

- $C_{\alpha}$  changes as we solidify.
- Cu-Ni case: First  $\alpha$  to solidify has  $C_{\alpha} = 46$  wt% Ni.  
Last  $\alpha$  to solidify has  $C_{\alpha} = 35$  wt% Ni.
- Fast rate of cooling:  
Cored structure
- Slow rate of cooling:  
Equilibrium structure

# Mechanical Properties: Cu-Ni System

- Effect of solid solution strengthening on:

--Tensile strength ( $TS$ )

Adapted from Fig. 9.6(a), Callister 7e.

--Peak as a function of  $C_0$

--Ductility ( $\%EL, \%AR$ )

Adapted from Fig. 9.6(b), Callister 7e.

--Min. as a function of  $C_0$

# Binary-Eutectic Systems

2 components

has a special composition with a min. melting T.

Ex.: Cu-Ag system

- 3 single phase regions ( $L$ ,  $\alpha$ ,  $\beta$ )
- Limited solubility:  
 $\alpha$ : mostly Cu  
 $\beta$ : mostly Ag
- $T_E$ : No liquid below  $T_E$
- $C_E$ : Min. melting  $T_E$  composition
- **Eutectic transition**

Adapted from Fig. 9.7,  
Callister 7e.

## EX: Pb-Sn Eutectic System (1)

- For a 40 wt% Sn-60 wt% Pb alloy at 150°C, find...

--the phases present:  $\alpha + \beta$

--compositions of phases:

$$C_o = 40 \text{ wt\% Sn}$$

$$C_\alpha = 11 \text{ wt\% Sn}$$

$$C_\beta = 99 \text{ wt\% Sn}$$

--the relative amount of each phase:

$$W_\alpha = \frac{S}{R+S} = \frac{C_\beta - C_o}{C_\beta - C_\alpha}$$

$$= \frac{99 - 40}{99 - 11} = \frac{59}{88} = 67 \text{ wt\%}$$

$$W_\beta = \frac{R}{R+S} = \frac{C_o - C_\alpha}{C_\beta - C_\alpha}$$

$$= \frac{40 - 11}{99 - 11} = \frac{29}{88} = 33 \text{ wt\%}$$

Adapted from Fig. 9.8,  
Callister 7e.

## Ex: Pb-Sn Eutectic System (2)

For a 40 wt% Sn-60 wt% Pb alloy at 200°C, find...

--the phases present:  $\alpha + L$

--compositions of phases:

$$C_0 = 40 \text{ wt\% Sn}$$

$$C_\alpha = 17 \text{ wt\% Sn}$$

$$C_L = 46 \text{ wt\% Sn}$$

--the relative amount of each phase:

$$W_\alpha = \frac{C_L - C_0}{C_L - C_\alpha} = \frac{46 - 40}{46 - 17}$$

$$= \frac{6}{29} = 21 \text{ wt\%}$$

$$W_L = \frac{C_0 - C_\alpha}{C_L - C_\alpha} = \frac{23}{29} = 79 \text{ wt\%}$$

Adapted from Fig. 9.8,  
Callister 7e.

# Microstructures in Eutectic Systems: I

- $C_o < 2 \text{ wt\% Sn}$
- Result:
  - at extreme ends
  - polycrystal of  $\alpha$  grains  
i.e., only one solid phase.

Adapted from Fig. 9.11,  
Callister 7e.

# Microstructures in Eutectic Systems: II

- $2 \text{ wt\% Sn} < C_o < 18.3 \text{ wt\% Sn}$
- Result:
  - Initially liquid +  $\alpha$
  - then  $\alpha$  alone
  - finally two phases
    - $\alpha$  polycrystal
    - fine  $\beta$ -phase inclusions

Adapted from Fig. 9.12,  
Callister 7e.

# Microstructures in Eutectic Systems: III

- $C_0 = C_E$
- Result: Eutectic microstructure (lamellar structure)  
--alternating layers (lamellae) of  $\alpha$  and  $\beta$  crystals.

Adapted from Fig. 9.13,  
Callister 7e.

Micrograph of Pb-Sn  
eutectic  
microstructure

160  $\mu\text{m}$

Adapted from Fig. 9.14, Callister 7e.

# Lamellar Eutectic Structure

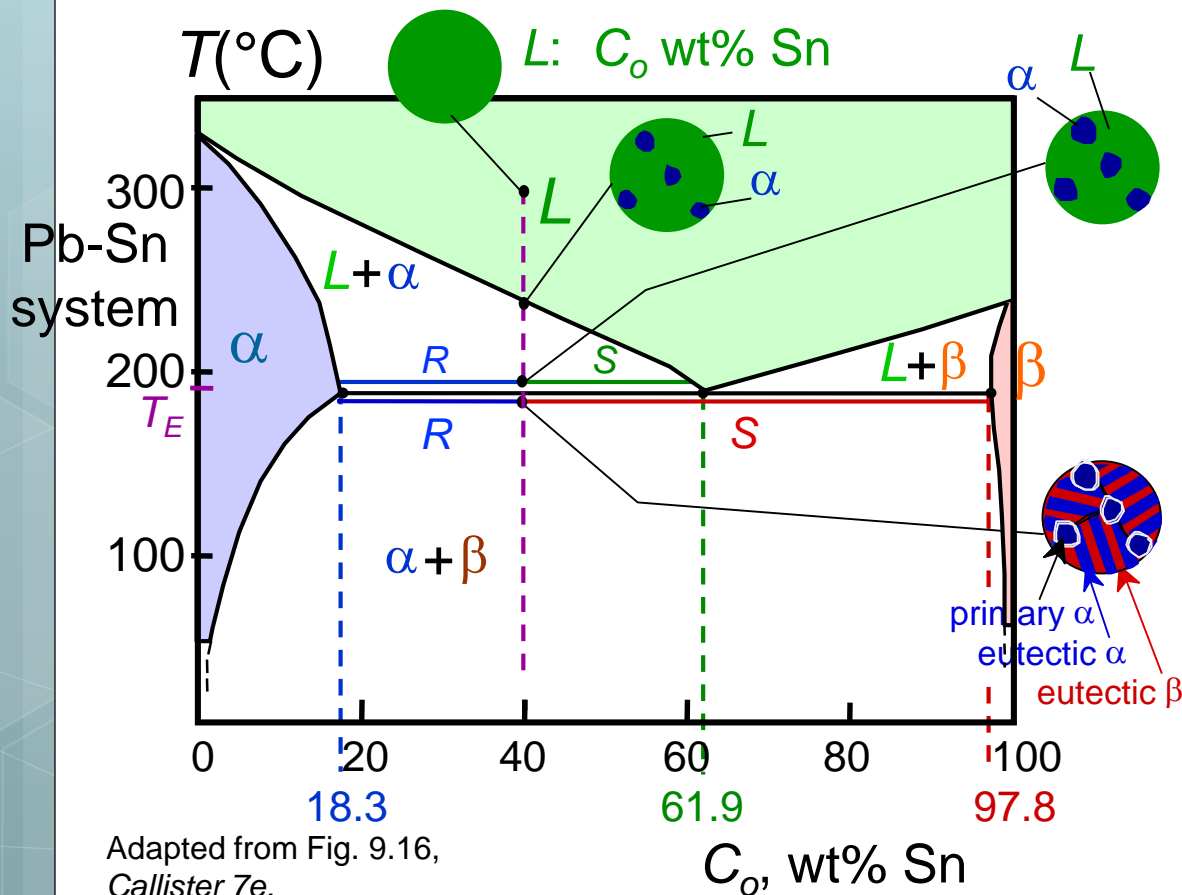

Adapted from Figs. 9.14 & 9.15, *Callister 7e*.

# Microstructures in Eutectic Systems: IV

- 18.3 wt% Sn <  $C_0$  < 61.9 wt% Sn
- Result:  $\alpha$  crystals and a eutectic microstructure

Adapted from Fig. 9.16,  
Callister 7e.

- Just above  $T_E$ :
  - $C_\alpha = 18.3$  wt% Sn
  - $C_L = 61.9$  wt% Sn
  - $W_\alpha = \frac{S}{R+S} = 50$  wt%
  - $W_L = (1 - W_\alpha) = 50$  wt%
- Just below  $T_E$ :
  - $C_\alpha = 18.3$  wt% Sn
  - $C_\beta = 97.8$  wt% Sn
  - $W_\alpha = \frac{S}{R+S} = 73$  wt%
  - $W_\beta = 27$  wt%

# Hypoeutectic & Hypereutectic

Adapted from Fig. 9.8, *Callister 7e*. (Fig. 9.8 adapted from *Binary Phase Diagrams*, 2nd ed., Vol. 3, T.B. Massalski (Editor-in-Chief), ASM International, Materials Park, OH, 1990.)

hypoeutectic:  $C_0 = 50 \text{ wt\% Sn}$

175  $\mu\text{m}$

eutectic  
61.9

eutectic:  $C_0 = 61.9 \text{ wt\% Sn}$

160  $\mu\text{m}$

eutectic micro-constituent

hypereutectic: (illustration only)

(Figs. 9.14 and 9.17 from *Metals Handbook*, 9th ed., Vol. 9, *Metallography and Microstructures*, American Society for Metals, Materials Park, OH, 1985.)

# Summary

- **Phase diagrams** are useful tools to determine:
  - the number and types of phases,
  - the wt% of each phase,
  - and the **composition** of each phasefor a given  $T$  and composition of the system.
- Alloying to produce a solid solution usually
  - increases the tensile strength ( $TS$ )
  - decreases the ductility.
- Binary **eutectics** and binary **eutectoids** allow for a range of microstructures.
