Linear Functions, Graphs in Rectangular Coordinates and Lines

## Graphs in Rectangular Coordinates

An ordered pair of real numbers is a pair of real numbers in which the order is specified, and is written by enclosing a pair of numbers in parentheses and separating them with a comma. The ordered pair $(a, b)$ has first component $a$ and second component $b$. Two ordered pairs $(x, y)$ and $(a, b)$ are equal if and only if $x=a$ and $y=b$.
The sets of ordered pairs of real numbers are identified with points on a plane called the coordinate plane or the Cartesian plane.

## Definitions

We begin with two coordinate lines, one horizontal ( $\boldsymbol{x}$-axis) and one vertical ( $\boldsymbol{y}$-axis), that intersect at their zero points. The point of intersection of the $x$-axis and $y$-axis is called the origin. The $x$-axis and $y$-axis are called coordinate axes, and the plane formed by them is sometimes called the $x y$-plane.
The axes divide the plane into four regions called quadrants, which are numbered as shown in the next slide. The points on the axes themselves do not belong to any of the quadrants.

## Definitions

The figure shows how each ordered pair $(a, b)$ of real numbers is associated with a unique point in the plane $P$, and each point in the plane is associated with a unique ordered pair of real numbers. The first component, $a$, is called the $\boldsymbol{x}$-coordinate of $P$ and the second component, $b$, is called the $\boldsymbol{y}$-coordinate of $P$, since we have called our horizontal axis the $x$-axis and our vertical axis the $y$-axis.

## Definitions

The $x$-coordinate indicates the point's distance to the right of, left of, or on the $y$-axis. Similarly, the $y$-coordinate of a point indicates its distance above, below, or on the $x$-axis. The signs of the $x$ - and $y$ coordinates are shown in the figure for each quadrant. We refer to the point corresponding to the ordered pair $(a, b)$ as the graph of the ordered pair $(a, b)$ in the coordinate system. The notation $P(a, b)$ designates the point $P$ in the coordinate plane whose $x$-coordinate is $a$ and whose $y$-coordinate is $b$.

Graph the following points in the $x y$-plane:

$$
A(3,1), B(-2,4), C(-3,-4), D(2,-3), E(-3,0)
$$

## Solution

$A(3,1) \quad 3$ units right, 1 unit up
$B(-2,4) \quad 2$ units left, 4 units up
$C(-3,-4) 3$ units left, 4 units down
$D(2,-3) \quad 2$ units right, 3 units down
$E(-3,0) \quad 3$ units left, 0 units up or down

## EXAMPLE 1 Graphing Points

## Solution continued

## Definitions

The points where a graph intersects (crosses or touches) the coordinate axes are of special interest in many problems. Since all points on the $x$-axis have a $y$-coordinate of 0 , any point where a graph intersects the $x$-axis has the form $(a, 0)$. The number $a$ is called an $x$-intercept of the graph. Similarly, any point where a graph intersects the $y$-axis has the form ( 0 , $b$ ), and the number $b$ is called a $\boldsymbol{y}$-intercept of the graph.

## PROCEDURE FOR FINDING THE INTERCEPTS OF A GRAPH

Step1 To find the $x$-intercepts of an equation, set $y=0$ in the equation and solve for $x$.

Step 2 To find the $y$-intercepts of an equation, set $x=0$ in the equation and solve for $y$.

## EXAMPLE 1 Finding Intercepts

Find the $x$ - and $y$-intercepts of the graph of $y=2 x+3$.
Soltution: If $y=0$, then

$$
0=2 x+3 \quad \text { so that } \quad x=-\frac{3}{2}
$$

Thus, the $x$-intercept is $\left(-\frac{3}{2}, 0\right)$. If $x=0$, then

$$
y=2(0)+3=3
$$

Find the $x$ - and $y$-intercepts of the graph of the equation $y=x^{2}-x-2$.

## Solution

Step 1 To find the $x$-intercepts, set $y=0$, solve for $x$.

$$
\begin{aligned}
0 & =x^{2}-x-2 \\
0 & =(x+1)(x-2) \\
x+1 & =0 \quad \text { or } \quad x-2=0 \\
x & =-1 \quad \text { or } \quad x=2
\end{aligned}
$$

The intercepts are -1 and 2.

## Solution continued

Step 2 To find the $y$-intercepts, set $x=0$, solve for $y$.

$$
\begin{aligned}
& y=0^{2}-0-2 \\
& y=-2
\end{aligned}
$$

The $y$-intercept is -2 .

## The graph of the linear equation(Line)

The following steps can be used to draw the graph of a linear equation.

Step1 ) Select at least 2 values for x Step2 ) Substitute them in the equation and find the corresponding values for $y$
Step3 ) Plot the points on cartesian plane
Step4 ) Draw a straight line through the points.

EXAMPLE 1 sketch the graph of $y=2 x+3$.

| X | -2 | -1 | 0 | 1 |
| :---: | :---: | :---: | :---: | :---: |
| y | -1 | 1 | 3 | 5 |

|  |  |  |  |  |  |  |  |  |  |  | 4 | $\uparrow$ |  | T |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  | 5 |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  | - |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  | - | 1 |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  | -2 | -1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  | 1 |  |  |  |  |  |  |  |  | $\rightarrow$ |  |
| - |  |  |  |  |  |  |  |  |  |  |  | -1 |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  | $\cdots$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  | $\downarrow$ |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Example

Draw the graph with equation $y=2 x+3$.

## Solution

First, find the coordinates of some points on the graph. This can be done by calculating $y$ for a range of $x$ values as shown in the table.

| $x$ | -2 | -1 | 0 | 1 | 2 | 3 |
| :---: | :---: | :---: | :---: | :---: | :---: | :--- |
| $y$ | -1 | 1 | 3 | 5 | 7 | 9 |

The points can then be plotted on a set of axes and a straight line drawn through them.

Remark An equation can be graphed by finding the intercepts, plotting the points and drawing a straight line through the intercepts.

EXAMPLE 1 sketch the graph of $y=2 x+3$.
x-intercept

$$
\begin{aligned}
& y=0 \rightarrow 0=2 x+3 \\
& x=2 / 3
\end{aligned}
$$

$(2 / 3,0)$ is $x$-intercept
$y$ - intercept

$$
\begin{gathered}
x=0 \rightarrow \begin{array}{c}
y=2.0+3 \\
y=3
\end{array}
\end{gathered}
$$

$(0,3)$ y-intercept

## Example <br> Graph $2 x-3 y=6$.

Solution To find the $x$ intercept we set $y=0$ and solve the equation for $x$ :

$$
\begin{aligned}
2 x-3 y & =6 \\
2 x & =6 \\
x & =3
\end{aligned}
$$

Hence, the $x$ intercepts is $(3,0)$.
To find the $y$ intercept we set $x=0$ and solve the equation for

$$
\begin{aligned}
2 x-3 y & =6 \\
-3 y & =6 \\
y & =-2
\end{aligned}
$$

which implies the $y$ intercept is $(0,-2)$.

## LINES

## Slope of a Line

Many relationships between quantities can be represent conveniently by straight lines.
The slope of a nonvertical line that passes through the points $P\left(x_{1}, y_{1}\right)$ and $Q\left(x_{2}, y_{2}\right)$ is denoted by $m$ and is defined by

$$
\begin{aligned}
m & =\frac{\text { vertical change }}{\text { Horizontal change }} \\
& =\frac{y_{2}-y_{1}}{x_{2}-x_{1}}
\end{aligned}
$$

## Vertical and Horizontal Lines

Either the "rise" or "run" could be zero

We can characterize the orientation of a line by its slope.

| Zero Slope | horizontal line |
| :---: | :---: |
| Undefined slope | vertical line |
| Positive slope | line rises from left to right |
| Negative slope | line falls from left to right |

## EXAMPLE 1 Finding and Interpreting the Slope of a Line

Sketch the graph of the line that passes through the points $P(1,-1)$ and $Q(3,3)$. Find and interpret the slope of the line.

## Solution

Any two points determine a line; the graph of the line passing through the points $P(1,-1)$ and $Q(3,3)$ is sketched here.

## Solution continued

$$
P(1,-1) \text { and } Q(3,3)
$$

$$
\begin{aligned}
m & =\frac{\text { change in } y \text {-coordinates }}{\text { change in } x \text {-coordinates }}=\frac{y_{2}-y_{1}}{x_{2}-x_{1}} \\
& =\frac{(3)-(-1)}{3-(1)}=\frac{3+1}{3-1}=\frac{4}{2}=2
\end{aligned}
$$

## Interpretation

The slope of this line is 2 ; this means that the value of $y$ increases by exactly 2 units for every increase of 1 unit in the value of $x$. The graph is a straight line rising by 2 units for every one unit we go to the right.

The line in Figure 3.4 shows the relationship between the price $p$ of a widget (in dollars) and the quantity $q$ of widgets (in thousands) that consumers will buy at that price. Find and interpret the slope.
$p$ (price)

FIGURE 3.4 Price-quantity line.

Solution: In the slope formula (1), we replace the $x^{\circ} \mathrm{s}$ by $q$ s and the $y^{\prime}$ s by $p$ s. Either point in Figure 3.4 may be chosen as $\left(q_{1}, p_{1}\right)$. Letting (2.4) $=\left(q_{1}, p_{1}\right)$ and $(8,1)=\left(q_{2}, p_{2}\right)$, we have

$$
m=\frac{p_{2}-p_{1}}{q_{2}-q_{1}}=\frac{1-4}{8-2}=\frac{-3}{6}=-\frac{1}{2}
$$

The slope is negative, $-\frac{1}{2}$. This means that, for each 1 -unit increase in quantity (one thousand widgets), there corresponds a decrease in price of $\frac{1}{2}$ (dollar per widget). Because of this decrease, the line falls from left to right.

## Equations of Lines

Point-Slope Form: To find the equation of a line, when you only have two points. The point-slope form of the equation of a line is

$$
y-y_{1}=m\left(x-x_{1}\right)
$$

where mis the slope and $\left(x_{1}, y_{1}\right)$ is a given point.

## EXAMPLE 1

Find the point-slope form of the equation of the line passing through the point $(1,-2)$ and with slope $m=3$. Then solve for $y$.

## Solution

We have $x_{1}=1, y_{1}=-2$, and $m=3$.

$$
\begin{aligned}
& y-y_{1}=m\left(x-x_{1}\right) \\
& y-(-2)=3(x-1) \\
& y+2=3 x-3 \\
& y=3 x-5
\end{aligned}
$$

Find the equation of a line that passes through the point $(1,-3)$ with slope of 2

Solution: Using a point-slope form with $m=2$ and $\left(x_{1}, y_{1}\right)=(1,-3)$ gives

$$
\begin{aligned}
y-y_{1} & =m\left(x-x_{1}\right) \\
y-(-3) & =2(x-1) \\
y+3 & =2 x-2
\end{aligned}
$$

which can be rewritten as

$$
2 x-y-5=0
$$

Find the point-slope form of the equation of the line / passing through the points $(-2,1)$ and $(3,7)$. Then solve for $y$.

## Solution

First, find the slope. $m=\frac{7-1}{3-(-2)}=\frac{6}{3+2}=\frac{6}{5}$
We have $x_{1}=3, y_{1}=7$.

$$
y-y_{1}=m\left(x-x_{1}\right)
$$

$$
y-7=\frac{6}{5}(x-3)
$$

$$
y-7=\frac{6}{5} x-\frac{18}{5}
$$

$$
v=\frac{6}{x} x+\frac{17}{5}
$$

Find the equation of the line through the points $(-5,7)$ and $(4,16)$.

## Solution:

$$
m=\frac{16-7}{4-(-5)}=\frac{9}{9}=1
$$

Now use the point-slope form with $m=1$ and $\left(x_{1}, x_{2}\right)=(4,16)$. (We could just as well have used ( $-5,7$ )).

$$
\begin{aligned}
& y-16=1(x-4) \\
& y=x-4+16=x+12
\end{aligned}
$$

Find the point-slope form of the equation of the line with slope $m$ and $y$-intercept $b$. Then solve for $y$.

## Solution

The line passes through $(0, b)$.

$$
\begin{aligned}
y-y_{1} & =m\left(x-x_{1}\right) \\
y-b & =m(x-0) \\
y-b & =m x \\
y & =m x+b
\end{aligned}
$$

## SLOPE-INTERCEPT FORM OF THE EQUATION OF A LINE

The slope-intercept form of the equation of the line with slope $m$ and $y$-intercept $b$ is

$$
y=m x+b
$$

## EXAMPLE 1

Slope - Intercept Form
Find an equation of the line with slope 3 and $y$-intercept -4 .
Solution: Using the slope-intercept form $y=m x+b$ with $m=3$ and $b=-4$ gives

$$
\begin{aligned}
& y=3 x+(-4) \\
& y=3 x-4
\end{aligned}
$$

Find the slope and $y$-intercept of the line with equation $y=5(3-2 x)$.

## Solution:

Strategy: We shall rewrite the equation so it has the slope-intercept form $y=n x+b$. Then the slope is the coefficient of $x$ and the $y$-intercept is the constant term.

We have

$$
\begin{aligned}
& y=5(3-2 x) \\
& y=15-10 x \\
& y=-10 x+15
\end{aligned}
$$

Thus, $m=-10$ and $\vec{b}=15$, so the slope is -10 and the $y$-intercept is 15 .

If a vertical line passes through $(a, b)$ (see Figure 3.8), then any other point $(x, y)$ lies on the line if and only if $x=a$. The $y$-coordinate can have any value. Hence, an equation of the line is $x=a$. Similarly, an equation of the horizontal line passing through $(a, b)$ is $y=b$. (See Figure 3.9.) Here the $x$-coordinate can have any value.

FIGURE 3.8 Verticalline through ( $a, b$ ).

FIGURE 3.9 Horizontal line through ( $a, b$ ).

EXAMPLE
Equations of Horizontal and Vertical Lines
a. An equation of the vertical line through $(-2,3)$ is $x=-2$. An equation of the horizontal line through $(-2,3)$ is $y=3$.

TABLE 3.1 Forms of Equations of Straight Lines

$$

$$
y=b
$$

## PARALLEL AND PERPENDICULAR LINES

Let $I_{1}$ and $I_{2}$ be two distinct lines with slopes $m_{1}$ and $m_{2}$, respectively. Then
$I_{1}$ is parallel to $I_{2}$ if and only if $m_{1}=m_{2}$.
$I_{1}$ is perpendicular $I_{2}$ to if and only if $m_{1} \cdot m_{2}=-1$.
Any two vertical lines are parallel, and any horizontal line is perpendroutar to any vertical line.

## Solution:

The slope is

$$
m=\frac{y_{2}-y_{1}}{x_{2}-x_{1}}=\frac{-9+1}{-2-3}=\frac{8}{5}
$$

The equation of this line is

$$
\begin{aligned}
& y-y_{1}=m\left(x-x_{1}\right) \\
& y+1=\frac{8}{5}(x-3) \\
& y=\frac{8}{5} x-\frac{24}{5}-1 \\
& y=\frac{8}{5} x-\frac{29}{5} \quad \text { (slope intercept form) }
\end{aligned}
$$

The general form of this equation is

$$
8 x-5 y-29=0
$$

Find the equation of the line passes through $(-3,2)$ and parallel to $y=4 x-5$.

## Solution:

$l_{1}$ and $l_{2}$ are parallel $l_{1} / / l_{2}, m_{1}=m_{2} \quad l_{1}: y=4 x-5, m_{1}=4$

$$
m_{1}=m_{2}=4
$$

The equation of the line $l_{2}$ is

$$
\begin{aligned}
& y-y_{1}=m\left(x-x_{1}\right) \\
& y-2=4(x+3) \\
& y=4 x+12+2 \\
& y=4 x+14 \quad\left(l_{2}\right)
\end{aligned}
$$

EXAMPLE 4
Find the equation of the line passes through $(-3,2)$ and perpendicular to $\mathrm{y}=4 \mathrm{x}-5$.

$$
y-y_{1}=m\left(x-x_{1}\right)
$$

$l_{1}$ is perpendicular to $l_{2}$,

$$
m_{1} \cdot m_{2}=-1,4 m_{2}=-1, m_{2}=-\frac{1}{4}
$$

$$
y-2=-\frac{1}{4}(x+3)
$$

$$
y=-\frac{1}{4} x+\frac{5}{4}
$$

Find the equation of the line passes through $(2,-3)$ and it is vertical.

## Solution:

Line passes through (2,-3) and it has no slope and $y$ interceptand it is vertical.
The equation of the line is $x=2$.

EXAMPLE 6 Find the equation of the line passes through $(7,4)$ and perpendicular to $\mathrm{y}=-4$.

## Solution:

Line passes through $(7,4)$ and it is perpendicular to $y=-4$.
The slope of this line is $m_{1}=0 . m_{1} \cdot m_{2}=-1, m_{2}=-\frac{1}{0}=$ undefined The equation of the line $l_{2}$ is $\mathrm{x}=7$.
